SMALL NOTEBOOK · SAME METHOD, SMALLER BUDGET

One lecture = one spread, ~22 lines a page

Shown at roughly your notebook's proportions. The only real change: the 5-line summary becomes 3 lines and moves to the left page, so the right page is nothing but cues and notes.

✎ LEFT · DRAW

S1 / L3 — Spacecraft types **11/7 · p13**

DRAWING · ~11 lines tall
Your guess in light pencil. Corrected version in dark pencil beside or over it. One drawing per lecture. If the lecture has two pictures, pick the one you'd fail a quiz on.

⭐ 3 TAKEAWAYS · 3 lines
1. ___ 2. ___ 3. ___

🧠 SUMMARY · video closed · 3 lines
What it is · why it matters · the one number or rule

❓ RIGHT · CORNELL

CUES **NOTES**

QUESTIONS · 4–6 max

Short. One per idea.

"Why 35,786?"

"Rank the 6 types"

"?" for lost → Q bank

KEYWORDS · 8–10 lines max

Abbreviate hard:
sat · orb · atm · Δv · → · ∴ · w/ · b/c

One line per fact.

Box numbers and formulas.

Doesn't fit? Don't shrink your writing. Turn the page and start a second spread for the same lecture. Index both.

Line budget per lecture

Zone	Lines
Header	1
Drawing	~11
3 takeaways	3
Summary	3
Cues	4–6
Keyword notes	8–10

The budget is a feature. A small page forces you to choose what matters, which is the thinking that makes it stick. Running out of room means "decide," not "write smaller."

⚡ Count the lines on one of your pages and tell me the number. I'll match every future PDF to it.

SMALL NOTEBOOK · SETUP

Reserved pages, shrunk to fit

Same four reserved spots as the big-notebook version, with fewer pages each. Still do this once before Lecture 1.

📌 Reserve these

Where	What	Size
Inside front cover	Review tracker (section × +1/+3/+7/+14/+30)	7 rows, fits
Page 1	Index: section / lecture → page	1 page (~22 lectures)
Page 2	Equations & key numbers	1 page
Page 3	Abbreviation key + highlighter key	½ page each
Last 6 pages	Question bank, Q on left page, A on facing page	3 spreads

🔤 Abbreviation key (write it on page 3)

sat = satellite · s/c = spacecraft · orb = orbit/orbiter · atm = atmosphere
Δv = change in speed (fuel cost) · alt = altitude · T = period
→ = leads to · ∴ = therefore · ≈ = about · ↑↓ = more/less
w/ = with · b/c = because · vs = compared to · ex: = example
LEO / MEO / GEO · ISS · GPS · EDL = entry, descent, landing

🖍 Highlighter key (same as before)

yellow term to know pink equation / number blue question for Claude
green the "aha" orange my mistake → Q bank
Color goes on at the +1 day review, only on what you couldn't recall.

✂️ What gets cut on a small page

- **Full example tables.** One example per type, inline: "orbiter (Cassini)". Not a 3-column table.
- **Second drawings.** One per lecture. The other one lives in my PDF, which you can look at any time.
- **Long cues.** "Why 35,786?" not "Why is GEO at exactly 35,786 km and not somewhere else?"
- **Nothing from the method.** Draw first, questions in cues, summary with the video off, come back on schedule. That all still happens.

📄 My PDFs from now on

Each one will show the spread at your page's proportions with the line budget above, so what you see is what fits. The teaching detail, fact checks, and question cards stay on a separate page you read on screen, not copy.
