WORD BANK · OFFICIAL TERMS · COPY THESE INTO THE BACK PAGES

Name it: the proper words, by section

One line each, in the shape **page · official name = also called · your 3–5 word meaning**. Fill in the page numbers from your own notebook. Guess the meaning out loud before you write each line. On the full spread, just add "→ WB" by the page number.

S1 — satellites, orbits, spacecraft types

p__ · geosynchronous (GSO) · 1-day lap, any tilt
p__ · geostationary (GEO) · 1-day lap + over equator, stays put
p__ · orbital period (T) · time for one lap
p__ · sidereal day · true spin, 23 h 56 m
p__ · constellation · swarm, one always overhead
p__ · footprint = coverage area · patch a sat can see
p__ · payload / bus · the job / the truck
p__ · mission types = the ladder · flyby → orbiter → probe → lander → rover → penetrator
p__ · delta-v (Δv) · speed change = fuel bill
p__ · capture burn = orbit insertion · brake so gravity grabs you
p__ · hyperbolic trajectory · open swing-past path, e > 1
p__ · EDL · entry, descent, landing

S2 — vacuum & atmosphere

p__ · outgassing (TML / CVCM) · gas leaking out of solids
p__ · bake-out · outgas it on the ground first
p__ · conduction / convection / radiation · touch / moving air / glow
p__ · spacecraft charging = ESD · static builds, then sparks
p__ · Newton's 1st law = inertia · motion keeps going
p__ · UV photodegradation · photons snap polymer bonds
p__ · MLI = thermal blanket · crinkly gold wrap
p__ · homosphere / heterosphere · stirred mix / sorted by weight
p__ · turbopause · ~100 km, mixing stops
p__ · photodissociation · light splits O_2 → O + O
p__ · atomic oxygen (AO) · lone O atom, 200–600 km, eats plastic
p__ · ionosphere · 60–1000 km, charged, bends radio
p__ · ram / wake · front face / sheltered back
p__ · atmospheric drag · thin air slows LEO sats

S3 — orbital mechanics

p__ · Classical Orbital Elements = Keplerian elements · the 6 hoop settings
p__ · RAAN (Ω) = longitude of ascending node · swivel
p__ · argument of periapsis (ω) · spin in plane
p__ · true anomaly (ν) · where the bead is now
p__ · line of apsides · perigee ↔ apogee, = major axis
p__ · line of nodes · where hoop cuts equator
p__ · vernal equinox (♈) · fixed zero direction
p__ · vis-viva · $v^2 = \mu(2/r - 1/a)$, speed anywhere
p__ · Hohmann transfer · lazy half-ellipse, 2 burns
p__ · Lambert's problem · 2 points + time → orbit + Δv
p__ · synodic period · lineup repeats, Mars 26 mo
p__ · phase angle · how far ahead target must be
p__ · patched conics / sphere of influence · stitched 2-body pieces
p__ · gravity assist = flyby = slingshot · bounce off moving planet
p__ · v_∞ / turning angle · speed far away / how much it bends

⚡ 41 lines. At ~22 lines a page that's two word-bank pages, which leaves two for the rest of the course. Cross out any you already have in the bank from before.
